Buttons hold buttonhole function,thread guide function,4 button/ buttonhole control function and many other functions.¶ Acting in function of sewing machine,CBT-0201 three funtion sewing machine can help you to make your sewing task a lot easier. (1) With the help of intuitive LED illuminated sewing light, you can focus on your sewing task, keeping your hands safe from direct sunshine, and make your work more convenient and comfortable. (2)The built-in auto threader function could make threading more convenient and accurate. (3) The sewn through buttons hold buttonhole function could help you stitch buttonholes. With the button hole control function, you could stitch buttonholes with just a click. You could stitch many buttons using CBT-0201 three funtion sewing machine. (4) There are two storage trays inside, you could get all the tools you need in one place. This invention relates generally to systems for collecting and distributing data, and more particularly to systems for providing access to data in a synchronized manner. As the use of computers in business has grown, so has the importance of controlling access to data stored in the computer. This is particularly true for computerized databases that store confidential business information such as customer or sales transaction information. The need for controlling access to the data increases as the size of the database grows. This is because a large database presents the threat of a security breach in the database. A number of systems have been developed for controlling access to data. For example, U.S. Pat. No. 5,280,536 discloses a computerized system in which access to information is granted or denied based on identity. The system described in the ""536 patent includes a central database which contains all of the information stored in the database, and which also includes data regarding the identity of those individuals who are authorized to access the information. The central database is maintained by a data base administrator. A user having access to the central database can access the database only by entering a valid identity code into the system. U.S. Pat. No. 5,724,054 discloses a system in which a portable code is created for an individual to allow the individual to access information from a centralized database. The ""054 patent discloses generating the portable code by using a personal identification number (PIN) entered by the individual, a key entered by the individual, and other information that can be associated with the individual. The portable 82157476af
